

# Continuous Integration

Jérôme Dockès

Nilearn Dev Days 2020

# Continuous Integration (CI)

- One shared master branch
- Small changes merged in frequently
- master kept bug-free and ready to deploy

Relies on:

- Version control
- Automated testing and quality control

# Software should be like a firefighter

- Ready to jump into action
- Reliable once on site

This entails

- Keeping master up-to-date: incremental changes
- Constantly testing on diverse environments

We can get it easily and for free!

# Illustration on a toy package: brain\_coords

[https://github.com/jeromedockes/brain\\_coords](https://github.com/jeromedockes/brain_coords)

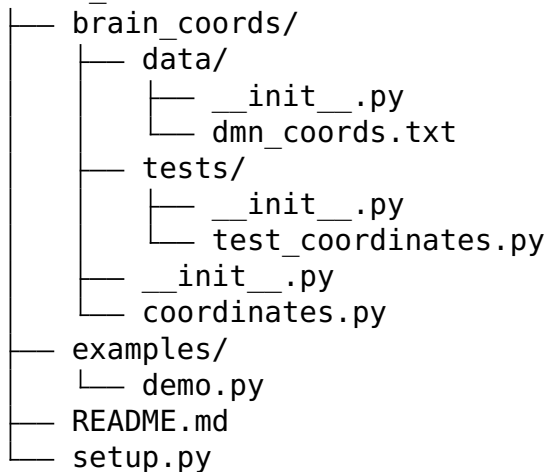

```
from nilearn import plotting
from brain_coords.coordinates import (
    coords_to_img, load_coords)

img = coords_to_img(load_coords())
plotting.plot_stat_map(img, colorbar=False)
```

# brain\_coords

brain\_coords/

See [this](#) and [this](#) for arguments for a different layout.

brain\_coords.coordinates.load\_coords

```
def load_coords(coords_file=None):
    if coords_file is None:
        coords_file = (
            pathlib.Path(__file__).parent
            / "data"
            / "dmn_coords.txt"
        )
    coords_file = pathlib.Path(coords_file)
    if (ext := coords_file.suffix) != ".txt":
        print("We expect .txt format")
    return np.loadtxt(str(coords_file))
```

setup.py

```
setup(
    name="brain_coords",
    packages=find_packages(),
    install_requires=["nilearn"],
    python_requires=">=3",
)
```

# pytest --cov=brain\_coords

"Works on my machine / my container"

(for better local automated testing use [tox](#) – can be combined with what follows)

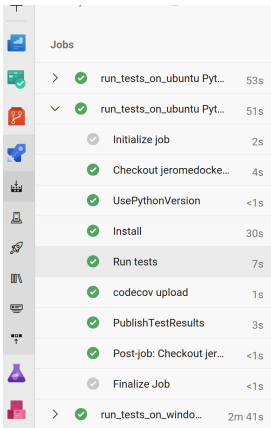

# Continuous integration platforms

- Azure pipelines, Travis, CircleCI, AppVeyor ...
- set up an account; have it follow our repository
- add a configuration file to the repository
- CI tools listens to some events:
  - pushing to a branch
  - pull requests
- events trigger a "build":
  - obtain resources on the provider's infrastructure
  - clone the repository
  - run our tests or whatever we ask for in the configuration
  - store results ("artifacts")
- for PRs, checkout is a merge commit into the target branch

# Setting up Azure pipelines

- Add configuration file `azure-pipelines.yml`
- Set up account
- Add uploading codecov reports and saving artifacts

# Azure Pipelines

Continuously build, test, and deploy to any platform and cloud

[Start free >](#) [Start free with GitHub >](#)

The screenshot shows the Azure DevOps web interface in a browser. The browser's address bar displays the URL `https://dev.azure.com/jeromeRjlwe5f6zCDqJBVU/`. The page title is "Projects - Home". The left sidebar contains the "Azure DevOps" logo and a search bar. Below the search bar, there is a list of organizations: "jeromeRjlwe5f6zCDqJBVU" (selected), "Parietal", and "neuroquery", along with a "New organization" link. The main content area is titled "jeromeRjlwe5f6zCDqJBVU" and features a "New project" button. Below the title, there are tabs for "Projects", "My work items", and "My pull requests". The "Projects" tab is active, and it displays a message: "No match found." with a "Reset filter" button. A filter icon and a close button are also visible.

← New variable

Name

CODECOV\_TOKEN

Value

.....

☒ Keep this value secret

☐ Let users override this value when running this pipeline

**To reference a variable in YAML**, prefix it with a dollar sign and enclose it in parentheses. For example: `$(CODECOV_TOKEN)`

**To use a variable in a script**, use environment variable syntax. Replace  and space with `_`, capitalize the letters, and then use your platform's syntax for referencing an environment variable. Examples:

Batch script: `%CODECOV_TOKEN%`

PowerShell script: `$env:CODECOV_TOKEN`

Bash script: `$CODECOV_TOKEN`

**To use a secret variable in a script**, you must explicitly map it as an environment variable.

# Summary

- repo on GitHub
  - create Azure pipelines account and project
  - add `azure-pipelines.yml`
  - install codecov GitHub app
  - that's it!
- 
- very similar with other CI platforms
  - See [brain\\_coord repo](#) for travis, circleci(, tox)
  - Read the CI configuration of your favorite projects!
  - Use [tox](#)
- 
- Complementary to code reviews

# Nilearn's CI infrastructure

- [Travis](#): unit tests, doctests and flake8 on Linux
- [circleci](#): building documentation and example gallery
- [Azure pipelines](#): unit tests on Windows
- [codecov](#): assembles and displays coverage reports

nilearn

```
├── .travis.yml
├── setup.py*
├── azure-pipelines.yml
├── codecov.yml
├── .circleci/
│   └── config.yml
└── nilearn/
    └── __init__.py
```

# Building doc: dataset download caching

- after build on circleci, `nilearn_data`, `miniconda3` and `doc` are saved
- `full-build` ignores the cache. runs:
  - when pushing to master
  - once per day
- `quick-build` runs for PRs.
  - `nilearn_data` and `miniconda3` always restored
  - `doc` restored if:
    - cache was written today
    - `.circleci/docs-cache-timestamp` has not changed

TL;DR if you want to force running sphinx:

```
date -Is > .circleci/docs-cache-timestamp
```

# A few tips

- Before pushing:
  - test new code:  
`pytest --pyargs nilearn.some.test.module`
  - test code and doctests: `make test`
  - run new examples
  - `make doc` to build doc without running examples
- CI failures are usually genuine
- But not always: failing downloads, dependency releases
- Answer is usually in the logs
- Download log and search for "FAIL"
- Ask for help!
